

Vulnerability Assessment Report

By: Samra Memon

Student of SZABIST University

Hyderabad Campus

 Operating System: Windows 10

1. Security Assessment Performed

A simple security review was conducted of the main computer system to reveal any potential security concerns in system settings, software patches and account security configurations.

The following checks were made:

- Firewall configuration check
- Check for updates to the Windows operating system.
- The 2-Step Verification helps safeguard your accounts. The 2-Step Verification is a security measure to protect your account.

2. Vulnerabilities / Findings

Known Issues:

Issue 1: Pending Windows Updates.

Auditing revealed that there were security patches that were not installed on the Windows operating system.

Risk:

Unpatched systems may be susceptible to recognized security exploits, malware attacks and system compromise.

Risk Level: Medium

Issue 2: Two-Step Verification is missing on Google Account.

Two Step Verification was not enabled for the Google account that was connected.

Risk:

No second layer of authentication, so if the account password is compromised, unauthorized users can gain access.

Risk Level: High

Issue 3: Firewall Protection is ON.

Windows Firewall is on.

Status: Secure Configuration

Observation:

Firewall protection prevents unauthorized incoming connections, and shields the system from network-based attacks.

3. Remediation Actions

The following improvements have been recommended in terms of security:

Run all Windows security patches as soon as they become available

Add Two-Step Verification option to Google account for extra security:

Ensure firewall is kept on at all times and never turn it off during software installation.

4. Final Verification

After reviewing the system configuration:

- Windows Firewall → Enabled

You will see the following message: The following message will appear:

Google 2-Step Verification: Disabled (must be enabled)

Conclusion

The security audit found that there were vulnerabilities related to delayed software updates, weak account authentication settings. The firewall was correctly configured. The fixes recommended will enhance the overall security of the system and make it less vulnerable to unauthorized access and cyber attacks.
